It currently consists of 8 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

CRIO 18A, UK. E-mail enquiries: humquery@sanger.ac.uk Clone
requests: clonerequest@sanger.ac.uk mquery@sanger.ac.uk Clone
on or before May 15, 2001 this sequence version replaced
gi:958163, gi:1218084.

During sequence assembly data is compared from overlapping clones.

Where differences are found these are annotated as variations
together with a note of the overlapping clone, as we submit sequence but the
variation annotation may not be found in the sequence submission
corresponding to the overlapping clone, as we submit sequences with
only a small overlap as described above.

This sequence was finished as follows unless otherwise noted all
regions were either double-stranded or sequenced with an alternate
chemistry or covered by high quality data (i.e., phred quality >=
30); an attempt was made to resolve all sequencing problems, such
as compressions and repeats; all regions were covered by at least
one plasmid subclone or more than one M13 subclone; and the
assembly was confirmed by restriction digest. The following
abreviations are used to associate primary accession numbers given
in the feature table with their source databases: Em., EMBL; Sw.,
SWISSPROT; Tr; TREMBL; Mg.; WORMPEP; Information on the WORMPEP

RPH1-131123 is from the library RPCT-111. constructed by the group
the pick of both at the library RPCT-111. constructed by the group
the pick of both and by the Sanger Centre Chomosome 1 Mapping
Group.

RPH1-131123 is from the library RPCT-111. constructed by the group
the pick of both and by the Sanger Centre Chomosome 1 Mapping
sequence. The true left end of clone RP1-131123 is at 188933 in this
sequence. The true left end of clone RP1-131123 is at 198931 in this
sequence. The true right end of clone RP1-13112 is at 198931 in this
this sequence. The true right end of clone RP4-61171 is at 194047
in this sequence.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 40
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  41 AlaArgAlaGluArgGlnHisGlnLeuTyrValGlyValLeuGlySerLysLeuGlyLeu 60
                                                                                                                                                                                                                                                                                                                                                             Nucleotides encoding methylarginase polypeptides, vectors comprising these mucleotides and the polypeptides themselves can be used in medicaments for the treatment of hyperlipidemia, renal failure, hypertension, restenosis after angioplasty, atherosolerosis, complications of heart failure, schizophrenia, multiple sclerosis or cancer. Modulators of the enzyme can be used in medicaments for the treatment of ischemia-reperfusion injury of the brain or heart, cancer, lethal hypertension in severe inflammatory conditions such as septic shock or multi-organ failure, or local and systemic inflammatory disorders including arthritis, skin disorders, inflammatory cardiac disease, migraine, or microbial or bacterial infection
                                                                                                                                                                                               Novel methylarginase polypeptides and polynuclectides, used to identify modulators of them, which are used in the treatment of e.g. cancer, hypertension, and bacterial infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    MetAlaGlyLeuGlyHisProSerAlaPheGlyArgAlaThrHisAlaValArgAla

The invention relates to a variant dimethylarginine

dimethylaminohydrolase-1 (DDAH 1; ADPT)464) and a nucleic acid encoding

cit (ADPT)463). DDAHs regulate the metabolism of ADMA (asymmetrical

dimethylaminohydrolase-1 (DDAH 1; ADPT)464) and a nucleic acid encoding

cit (ADPT)463). DDAHs regulate the metabolism of ADMA (asymmetrical

disease and diabetes. The DDAH igene is located on chromosome 1, which

combined hyperlipidaemia, premature coronary artery disease (CAD), non

corresponding to base 260 in ADF1463 and ADF71465. Individuals hetero-

corresponding to base 260 in ADF71463 and ADF71465. Individuals hetero-

corresponding to base 260 in ADF71463 and ADF71465. Individuals hetero-

corresponding to acadiovascular diseases and diabetes. The invention also

corrected a DDAH I CDNA capture probe; a method and kit for diagnosing a susceptibility to a cardiovascular disease and diabetes in an individual

corrected availations of diabetes by enhanoing mitric oxide

availabhility production or concentration; a method of tracting them with a drug

corpulation or concentration; a method of cargeting

that affects nitric oxide availabhility, production or metabolism; and cardiovascular disease and diabetes in a hypertensive

complications. The methods are useful for determining whether a patient

complications. The methods are useful for determining whether a patient

complications. The methods are useful for determining whather a patient

complications. The methods are useful for determining whether a patient

availabhility or concentration; can agant which elevates DDAH

availabhility or concentration; can an agant which elevates DDAH

availabhility or determining whether a patient which elevates because are suggened.

also useful for determining whether a patient which elevates are useful for

The invention relates to genes and their expression profiles are used for: (a) screening modulators of precursor stem cell differentiation into osteoblasts, or bone tissue deposition; (b) diagnosing abnormal costeoblasts or cone tissue deposition; (b) diagnosing abnormal costeoprosis; or cone tissue, abnormal rate of osteoprist formation or osteoprosis; or monitoring treatment of the conditions colted in (b), or monitoring the progression of bone tissue deposition. Specific conditions include postmenopausal osteoprosis, glucocorticoid osteoprosis or male osteoprosis, osteopenia, osteodystrophy, druginduced abnormalities in bone formation or bone loss, conditions that involve altered bone metabolism (e.g. idiopathic juvenile osteoporosis), skeletal disease linked to breast cancer, mastecoytosis, Fanconi syndrome or fibrous dysplasia. The present sequence is that of an osteoblast differentiation associated CODM marker of the invention. Note: The sequence data for this partent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        460

New human secretory proteins and polynucleotides, useful for diagnosing, treating or preventing autoimmune/inflammatory disorders (e.g. AIDS), neurological disorders (e.g. Alzheimer's), or cell proliferations or cancers.

Claim 1; SEQ ID NO 103; 458pp + Sequence Listing; English.

The invention relates to a secretory polymucleotide (designated sptm)

comprising any of 567 polymucleotide sequences (AB235837-AB236403), a

comprising any of 567 polymucleotide sequence at least 90 % identical to

the polymucleotide sequence, a polymucleotide complementary to them or an

content of them. The polypeptide or polymucleotide are useful for

RNA equivalent of them. The polypeptide or polymucleotide are useful for

treating, preventing or diagnosing a disease or condition associated with

the expression of functional SPTM. These are particularly useful for

the expression of functional SPTM. These are particularly useful for

chisquese), required immunodeficiency syndrome, anaemia, asthma or Crohm's

chisquese), neurological disorders (e.g. epilepsy, Huntington's disease,

chemitiple sclerosis, cerebral palsy, parkinson's disease,

comultiple sclerosis, cerebral palsy, parkinson's disease,

schizophrenia or amnesia), or cell proliferative disorders (e.g.

psoriasis, polycythemia vera, or cancers including adenocarcinoma,

comultiple sclerosis, cerebral palsy, sarcome or cancers of the brain,

schizophrenia or prostate). Note: The sequence data for this parent did

cont form part of the printed specification, but was obtained in electronic

The invention relates to an isolated polypeptide comprising 12 fully defined sequences of 81-615 amino acids given in the specification; a naturally occurring amino acid sequence at least 90% identical to, having acids, at least 97% identical to a sequence of 529 amino acids, at least 97% identical to a sequence of 529 amino acids, at least 97% identical to a sequence of 615 amino acids, all given in the specification; or a biologically active or immunogenic fragment of the polypeptide. The polypeptides and polymucleotides are useful in diagnosing treating and preventing diseases or conditions associated with the decreased expression or overexpression of a drug metabolising enzyme (DME), such as autoimmune/inflammatory (e.g. AIDS, atherosciences); contact dermatitis) cell-profiferative (e.g. Cancer, cirrhosis), developmental (e.g. diabetes), eye (e.g. glaucoma, expenditions), metabolis, characticis, encil-profiferative (e.g. glaucoma, extratits), metabolis (e.g. hyperlipidaemia, cystic fibrosis), contromed (e.g. gratroenteritis, diarrhoea), or liver (e.g. dastrointestinal (e.g. gratroenteritis, diarrhoea), or liver (e.g. chepatitis, Reye's syndrome) disorders. These are also useful in assessing the effects of fercegarders of Engernations of Engles of

containing nucleic acids by hybridising a substrate with the nucleic acids, thus forming one or more hybridisation complexes, detecting hybridisation complex formation and comparing the complexes formed with standard complexes. Where differences between the standard and the sample complexes, where differential expression of cDNAs in the sample. The differential expression of cDNAs in the sample complex formation indicate differential expression of cDNAs in the invention also relates to proteins and antibodies related to the cDNAs. The combination is useful for diagnosing, treating or monitoring the forgression of treatment of prostate cancer. The antibodies are useful for detecting prostate cancer. This sequence represents a human prostate cancer cDNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            107

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AAF15566 to AAF16505 encode the human prostate cancer associated proteins, called prostate cancer antigens, given in AAB56363 to AAB57302. The prostate cancer antigens can have neuroprotective, cytostatic, cardioactive, immunomodulatory, muscular, vulnerary, gastrointestinal, nephrotropic, antiinfective, gynaecological and antibacterial activities, and can be used in gene therapy. The prostate cancer antigen polynuclacities may be used for detection of prostate cancer, chromosome identification, as chromosome markers, and for numerous other diagnostic or research purposes. The prostate cancer antigens may be used to treat disorders such as neural, immune, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal, and proliferative disorders, wounds, and infectious diseases. New nucleic acid encoding a variant dimethylarginine dimethylaminohydrolase-1 (DDAH-1) protein, useful for treating diabetes, and its vascular complications, e.g. coronary or cerebrovascular disease or hypertension.

## Claim 4; SEQ ID NO 1; 37pp; English

The invention relates to a variant dimethylarginine dimethylaminohydrolase-I (DDMH 1; ADE71464) and a nucleic acid encoding it dimethylaminohydrolase-I (DDMH 1; ADE71464) and a nucleic acid encoding it dimethylaminohydrolase-I (DDMH 1; ADE71464) and an unitariate oxide which are relevant in disorders such as cardiovascular disease and diabetes. The DDMH 1 gene is located on chromosome 1, which chase and diabetes. The DDMH 1 gene is located on chromosome 1, which combined hyperlipidaemia, premature coronary artery disease (ADD), non insulin-dependent (type 2) diabetes mellitus, and diascolic hypertension. The variant DDMH 1 of the invention has Met at position 87, rather than the variant DDMH 1 of the invention has Met at position 87, rather than corresponding to base 260 in ADE71463 and ADE71465. Individuals heterocorresponding to base 260 in ADE71463 and ADE71465. Individuals heterocorresponding to base 260 in ADE71463 and ADE71465. Individuals heterocorresponding to base 260 in ADE71463 and ADE71465. Individuals heterocorresponding the DDMH 1 GDMA capture probe; a method and kit for diagnosing a susceptibility to a cardiovascular disease and diabetes. The invention also cardiovascular disease and diabetes in an individual by determining the DDMH 1 genotype and treating them with a drug which affects mitric oxide availability, production or concentration; a method of targeting cardiovascular disease and diabetes in a hypertensive patient by determining the DDMH 1 genotype and treating them with a drug whole are useful for determining whether a patient complications. The method are useful for determining whether a patient complications. The method are useful for determining whether a patient will benefit from treatment with a drug which affects mitric oxide availability, production or metabolism; a drug which heteres ADMH concentration; orn an agent which elevates DDAH captering availability or concentration; orn a patient will be method are administered. The presents a specifically decided and nucleic acid mel

The nucleotide sequences are up-regulated in the spinal cord in response to streetoxocin-induced diabetes. The present sequence is one such nucleotide sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 85 GluGluThrAlaLeuIleThrArgProGlyAlaProSerArgArgLysGluValAspMet

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes a method for determining whether a compound induces a toxic effect on a tissue or cell. The method comprises preparing a gene expression profile of a tissue or cell sample exposed to the compound, and comparing the gene expression profile to a database comprising data or information on the Tox mean and non-Tox mean value. The method is useful for predicting or identifying at least one toxic effect, particularly hepatotoxicity, of a test or unknown compound. The genes listed in the specification are useful as diagnostic or toxicity markers for the prediction or identification of the physiological state of tissue or cell sample that has been exposed to a compound, or to identify or predict the toxic effects of a compound or an agent. These may also be used as markers for monitoring toxicity progression or for drug screening. The present sequence represents a primary rat hepatocyte toxicity modelling related gene sequence from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    743

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to genes and their expression profiles are used for: (a) screening modulators of precursor stem cell differentiation into esteoblasts, or bone tissue deposition, (b) diagnosing abnormal deposition of bone tissue, abnormal rate of osteoblast formation or osteoporosis; or (c) treating or monitoring treatment of the conditions cited in (b), or monitoring the progression of bone tissue deposition. Specific conditions include posteoporosis, gluccorticoid esteoporosis or male osteoporosis, osteoporosis, durgenticoid

                 involve altered bone metabolism (e.g. idiopathic juvenile osteopozosis), skeletal disease linked to breast cancer, mastocytosis, Fanconi syndrome or fibrous dysplasia. The present sequence is that of an osteoblast differentiation associated cDNA marker of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

(HUMA-) HUMAN GENOME SCI INC

WPI; 2001-541565/60

Nucleic acids encoding 3224 human nervous system antigen polypeptides, useful for preventing, diagnosing and/or treating nervous system cancers and metastases.

Disclosure, SEQ ID NO 6973; 1701pp + Sequence Listing; English

The invention relates to novel genes (ABA11004-ABA21514) and proteins (ABB14678-ABB18001) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful in the diagnosist, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urigenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c)

```
cardiovascular disorders such as myocardial ischaemias, (d) wound healing; (e) neurological diseases e.g. cerebral anoxia and epilepsy, and (f) infectious diseases such as viral, bacterial, fungal and parasitic infections. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

(HUMA-) HUMAN GENOME SCI INC

Barash SC, Rosen CA,

WPI; 2001-541565/60

Nucleic acids encoding 3224 human nervous system antigen polypeptides, useful for preventing, diagnosing and/or treating nervous system cancers and metastases.

Disclosure, SEQ ID NO 6972; 1701pp + Sequence Listing; English

The invention relates to novel genes (ABA11004-ABA21534) and proteins

(ABB14678-ABB18001) useful for preventing, treating or ameliorating
medical conditions e.g. by protein or gene therapy. The genes are
isolated from a range of human tissues disclosed in the specification.

The nucleic acids, proteins, antibodies and (ant) agonists are useful in
the disgnosis, treatment and prevention of: d) cancer, e.g. breast and
ovarian cancer and other cancers of the adrenal gland, bone, bone marrow,
breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune
disorders e.g. Addison's disease, allergies, autoimmune haemolytic
anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease,
multiple sclerosis, rheumatoid arthritis and ulcerative colifis; (c)
cardiovascular disorders such as myocardial ischaemias; (d) wound healing
(e) neurological diseases e.g. cerebral anoxia and epilepsy; and (f)
infectious diseases such as viral, bacterial, fungal and parasitic
the printed specification, but was obtained in electronic format directly
from WIPO at ftp.wipo.int/pub/published\_pct\_sequences

Sequence 420 BP; 131 A; 95 C; 94 G; 97 T; 0 U; 3 Other;

```
The present sequence is one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. No ORF has yet been conclusively calculated within the present sequence. The 5' ESTs were prepared from cotal human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed obNA, libraries. Such ESTs are not well suited for isolating oDNA sequences derived from mRNAs and even in those cases where longer converted from mRNAs with inteat 5' ends and can therefore be used to obtain full length cDNAs with inteat 5' ends and can therefore be used to obtain upstream requiatory sequences mapping procedures. They are used to obtain upstream requiatory sequences mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion vectors

// note="Organ: brain; Vector: pYX-Asc; Site 1: EcoR I;
Site 2: Not I; The library was constructed according to
Bonaldo, Lennon and Soares, Genome Research, 6:791-806,
1996. Denatured mRNa was size fractionated on a 1% agarose
gel: First strand cDNA synthesis was primed with an
oligo-dT primer containing a Not I site. Double stranded
cDNA was size selected according to mRNA size fraction,
ligated with EcoR adaptor, digested with Not I, and then
cloned directionally into pYX-Asc vector. The library tag
sequence located between the Not I site and the polyA
tail, is GTGCGTGGAA. This library was created for the
University of Iowa Mouse Brain Molecular Anatomy Project
(BMAP): 'Gene Discovery in the Developing Mouse Nervous
System', supported by National Institutes of Mental Health
(NIMH), Hemin Chin, Ph.D., program coordinator:"

/U.F.F.DO is a cDNA library containing the following
tissue(s): rat embryo. The library was constructed
according to Bonaldo, Lennon and Soares, Genome Research,
6:791-806, 1996. First strand cDNA synthesis was primed
with an oligo-dr primer containing a Not I site. Double
stranded cDNA was ligated to an EcoR I adaptor, digested
with Not I, and cloned directionally into pT773-Pac
vector. The oligonucleotide used to prime the synthesis of
first-strand cDNA contains a library tag sequence that is
located between the Not I site and the (dT)18 tail. The
sequence tag for this library is CARTCTAACT. This library
was created for the University of Iowa Program for Rat
Gene Discovery and Mapping (Val Sheffield, Bento Soares
